Notechalant:

circle to ask, on any screen

Write on any screen from across the room. Circle anything to get it explained.

SwampHacks XII

Two problems

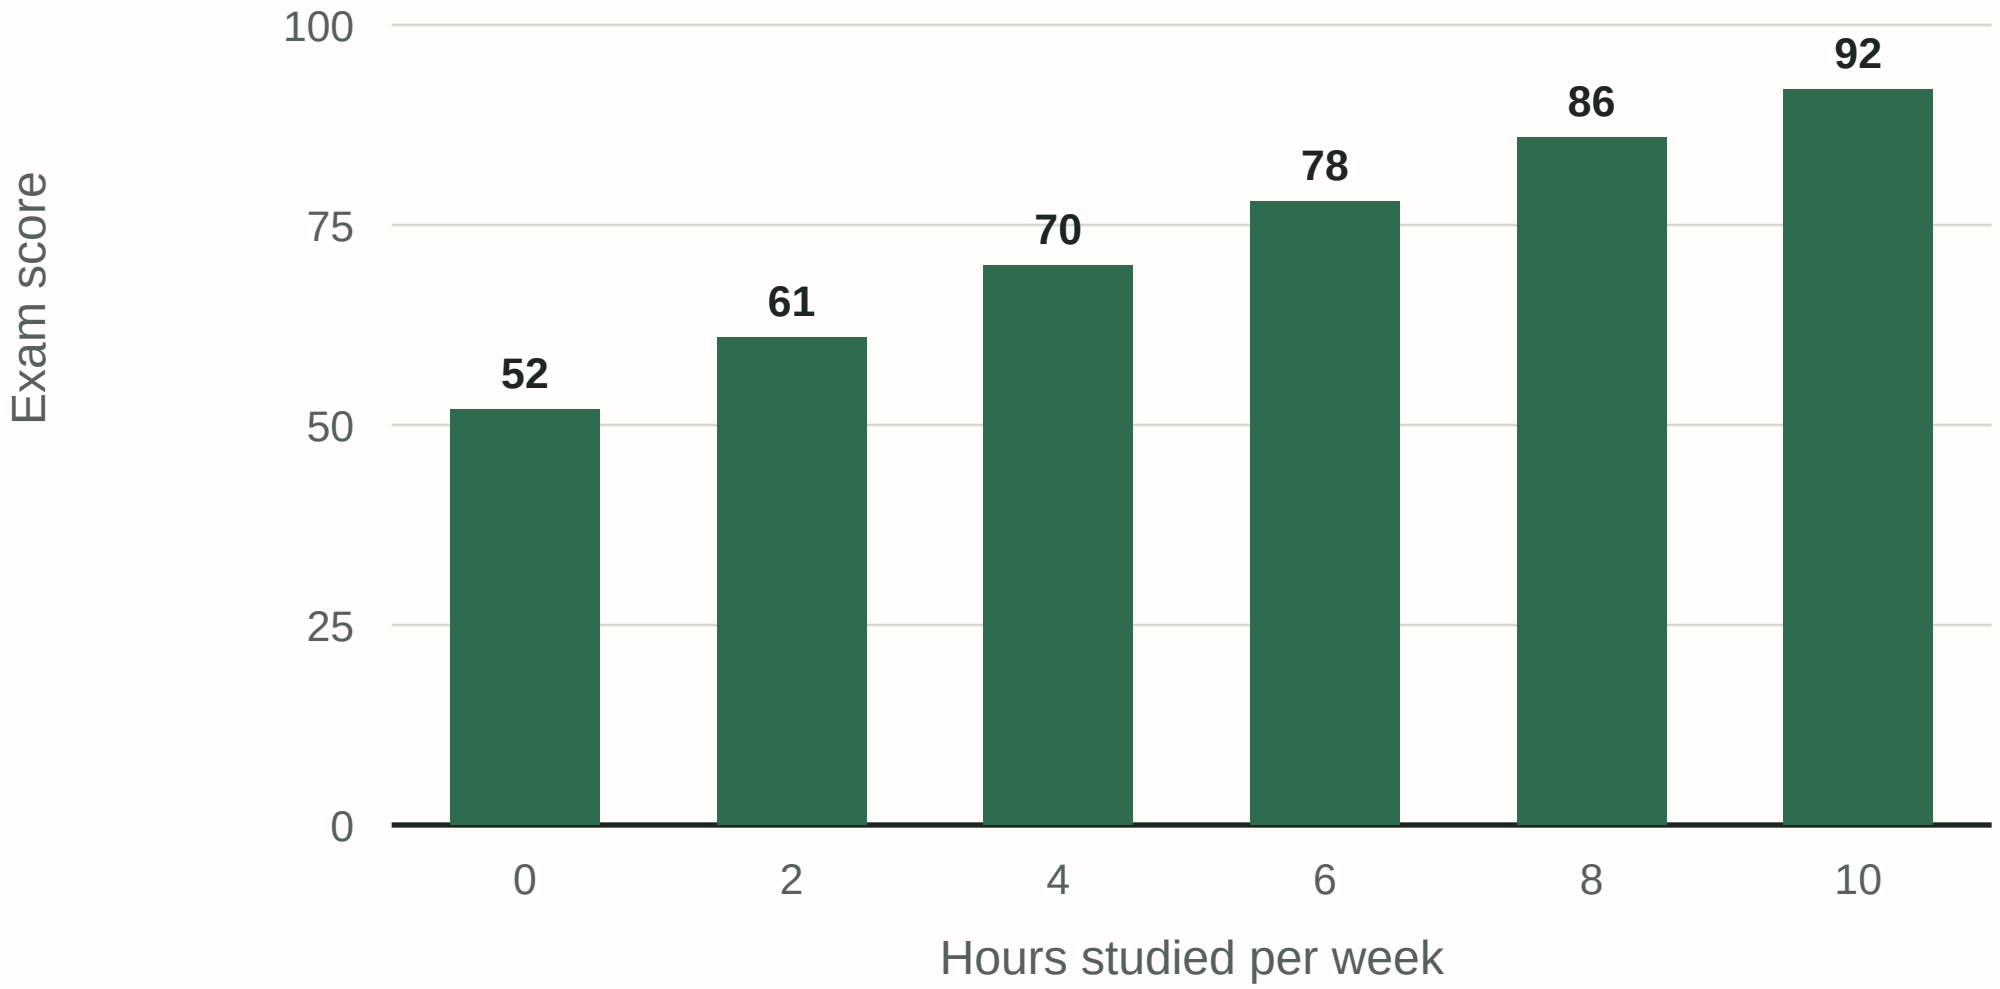
Solve for x

$$x^2 - 5x + 6 = 0$$

Find the derivative

$$\frac{d}{dx}(3x^2 + 2x)$$

More study, higher scores



What Big O notation means

Big O notation describes how an algorithm's running time or memory grows as its input size n grows, keeping only the fastest-growing term and dropping constant factors, so an algorithm that takes $3n^2 + 5n + 2$ steps is $O(n^2)$, because for large n the n^2 term dominates; it is an upper bound on growth, not an exact count of steps, which is why a slower-looking $O(n \log n)$ sort beats an $O(n^2)$ one on large inputs even if the $O(n^2)$ sort is faster on small ones.
